VOC	volatile organic compounds
WCH	West Coyote Hills
WHO	World Health Organization
XRF	x-ray fluorescence

Executive Summary

AECOM has prepared this Remedial Action Plan (RAP) to describe the proposed remedial excavation activities within Parcels 1 and 3 of the eastern portion of the former West Coyote Hills (WCH) oilfield located in Fullerton, California (Parcels 1 and 3 or Site). All current (2017-2019) and historical (1995-2005) soil data within the boundaries of Parcels 1 and 3 were compiled and evaluated against the selected screening and soil cleanup criteria.

Parcels 1 and 3 are designated for open space/ trail use and the likely human receptors at the Site will be trail users and trail maintenance workers. Based on this land use designation and the chemicals of potential concern (COPCs) that have been detected in Site soil and soil vapor, human health and ecological screening levels were sourced from several different agencies. To be conservative, commercial/industrial worker screening levels were selected for human health screening and the more stringent value selected from the Department of Toxic Substances Control (DTSC) Human Health Risk Assessment (HHRA) Note 3 Screening Levels and the Environmental Protection Agency (EPA) Regional Screening Levels (RSLs). Unpublished human health soil screening levels provided by the Orange County Health Care Agency (OCHCA) were applied for total petroleum hydrocarbons (TPH). Human health screening criteria were applied site-wide and to all exposure depths in the initial soil data screening. For purposes of identifying candidate locations for soil removal, however, only samples from 0 to 2 feet below ground surface (bgs) were considered, based on a maximum reasonable exposure scenario.

Ecological screening levels for soil were selected from the following hierarchy of sources: EPA's Ecological Soil Screening Levels (EcoSSLs), Los Alamos National Laboratory's (LANL's) Ecorisk database, and Oak Ridge National Laboratory risk guidance sources. Metals were also compared to regional background concentrations based on data collected from various California air force bases (Hunter et al., 2005). The background levels for metals were used in cases where the human health or ecological criteria were lower than the background levels. For TPH, the San Francisco Bay Regional Water Quality Control Board's (San Francisco Bay RWQCB's) Environmental Screening Levels (ESLs) for ecological receptors were applied at the request of the Office of Environmental Health Hazard Assessment (OEHHA). Once the soil data were compared to the ecological screening levels listed above, the cleanup criterion defined as an ecological hazard quotient (Eco HQ) ≥ 4.0, which was established by OCHCA and OEHHA for Parcels 1 and 3, was applied to identify exceedances for remedial excavation. Ecological screening criteria were applied site-wide and to all exposure depths in the initial soil data screening. For purposes of identifying candidate locations for soil removal, however, only samples collected from 0 to 6 feet bgs from locations outside of the trail boundaries were considered, reflective of the biologically active zone.

As a first step, to provide a comprehensive screening for Parcels 1 and 3, all soil data were compared to the screening levels described above for the following COPCs regardless of sample depth and location: metals, polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), dioxins/furans, and TPHs. Duplicate soil samples were treated as discrete samples for screening purposes. Then, to identify the locations for remedial consideration, the approved depth-specific soil cleanup criteria were applied: 0 to 2 feet bgs for human health (entire Site) and 0 to 6 feet bgs for ecological health (open space only as trails themselves will not provide viable habitat). A final cleanup level was calculated for each analyte based on the final criteria used to evaluate the exceedance.

Upon evaluation of the locations exceeding human health and/or ecological screening levels (or background levels for metals, where higher than screening levels), the final cleanup levels were selected as follows:

Locations Within Trail Boundaries

- ***0 to 2 feet bgs -*** Human health screening level is applicable. For metals with human health screening levels less than the background level, the background level is applicable.
- ***> 2 feet bgs -*** Not recommended for remediation – likelihood of human exposure is very low.

Locations Outside of Trail Boundaries

- ***0 to 2 feet bgs -*** Lower of human health screening level and ecological screening level multiplied by a factor of 4.0 (i.e., Eco HQ = 4.0) is applicable. For metals, when the applicable risk-based cleanup level is less than the background level, the background level is applicable.
- ***2 to 6 feet bgs -*** Ecological screening level multiplied by a factor of 4.0 (i.e., Eco HQ = 4.0) is applicable. For metals with ecological cleanup levels less than the background level, the background level is applicable.
- ***6 feet bgs -*** Not recommended for remediation – likelihood of human exposure is very low and depth exceeds the zone for burrowing animals, greatly reducing the potential for ecological exposures to occur.

1. Introduction

AECOM has prepared this Remedial Action Plan (RAP) on behalf of Pacific Coast Homes (PCH; a subsidiary of Chevron Land and Development Company) to propose remedial activities within Parcels 1 and 3 of the eastern open space portion of the former WCH oilfield (Parcels 1 and 3 or Site) located in Fullerton, California (**Figures 1, 2, and 3**). Land uses in the area covered by this RAP are limited to open space (hiking/trails) and conservation.

This RAP focuses on the analysis of historical (1995-2005) and current (2017-2019) data within Parcels 1 and 3 for the purpose of evaluating the need for soil remediation and confirmation sampling in these areas.

The Parcels 1 and 3 recent soil sampling activities were conducted from 2017 through 2019 in accordance with the *August 14, 2017 AECOM Eastern Trails/Open Space Soil Sampling Plan, West Coyote Hills* (August 2017 Plan) that was approved by Orange County Health Care Agency (OCHCA) on December 14, 2017 (electronic communication with Ms. Tamara Escobedo).

The previous work performed, Site background, and Site description are presented in **Section 1.0**. **Sections 2.0 through 4.0** provide the summary of remedial screening criteria used, procedures for the proposed soil excavation, monitoring, and disposal. References are provided in **Section 7.0**.

1.1 Project Objective and Approach

The primary purpose of this RAP is to identify locations that require remediation in accordance with the risk-based criteria set forth in **Section 2.0** and to provide guidelines for mitigation of potential soil impacts during remedial excavation activities at the Site. The remedial activities presented in this document are generally consistent with the RAP previously submitted by Blasland, Bouck, and Lee (BBL) and approved by OCHCA in 2005; this RAP has been updated to account for current regulatory criteria and to address new soil data obtained during the 2017 through 2019 sampling events.

The proposed remedial excavation activities are based on a human health and ecological screening level evaluation. Commercial/industrial standards were used for evaluating human health risk, and background levels for metals were taken into consideration. During meetings with OCHCA and OEHHA on November 5th and November 10th, 2020, the following soil cleanup criteria were approved for identifying candidate sample locations for soil removal:

- Exceedances of human health screening levels at soil depths between 0 to 2 feet bgs;
- Exceedances of ecological screening levels at depths between 0 to 6 feet bgs;
- Exceedances of the ecological hazard quotient (Eco HQ) ≥ 4.0 in the open space areas as trails will not provide viable habitat.

A two-step screening process was executed for purposes of this RAP. As a first step, to provide a comprehensive screening for Parcels 1 and 3, all soil data were compared to the selected human health and ecological screening levels regardless of sample depth and location (**Section 2.2.1 and 2.2.2**). Then, to identify the locations for remedial consideration, the approved depth-specific and location-specific soil cleanup criteria described above, as well as the Eco HQ ≥4.0 criterion, were applied (**Table 2; Section 2.3**).

A summary of the soil screening levels, background levels for metals, and the final selected screening level per analyte (i.e., lower of human health and ecological screening levels, or metals background if background is higher) are provided in **Table 1** and described in **Section 2.2.** The results of the soil screening comparison are presented in **Tables 3 and 4**. Application of the established soil cleanup criteria is discussed **Section 2.2.1.2 and 2.2.2.1** and presented in **Table**

2, and the proposed remedial excavation activities to address soils that meet these criteria are presented in **Section 2.4**.

1.2 Background and Site Description

The WCH property, which includes Parcels 1 and 3, is a former producing oilfield that ceased operations in the early 1990s. The WCH property is located approximately 4 miles north of the interchange between the Santa Ana Freeway (Interstate 5) and the Riverside Freeway (State Highway 91), between Coyote Creek to the east and Brea Creek to the west (**Figure 1**). The WCH property is approximately 510 acres in size, irregular in shape and is bordered on the west by the City of La Mirada, on the north by the City of La Habra, on the east by Euclid Street, and on the south by the City of Fullerton, the Robert E. Ward Preserve, and Castlewood Drive. There are no ongoing oil field operations at the WCH property. The County of Orange Sheriff Department maintains an emergency transmitter and the associated power lines on top of a hill in the western portion of the WCH.

The WCH property is separated by a public road, Gilbert Street, into an approximately 356.7 acre west Fullerton parcel (i.e., Western Property), which includes Planning Areas 4 to 9, the Multiple Use Area (MUA), commercial and open space/habitat conservation areas, and an approximately 153.3 acre east Fullerton parcel (i.e., Eastern Property), which includes additional open space/habitat conservation/hiking areas (PCH, 2009). The Eastern Property is immediately adjacent to a separate 72-acre property known as the Robert E. Ward Preserve, which was originally part of the historical WCH oilfield, but was transferred to the City of Fullerton in the 1990s (**Figure 2**). Parcels 1 and 3 are currently undeveloped and are approximately 11.08 and 13.75 acres in size, respectively.

PCH anticipates selling Parcels 1 and 3 to the City of Fullerton in 2021. As part of the anticipated sale, the deed for Parcels 1 and 3 will permanently restrict the parcels for passive open-space/park resource conservation uses with no enclosed buildings allowed.

1.2.1 Current Condition

The majority of the oil field related structures and assets have been removed from the greater WCH property. The facilities, equipment, and infrastructure that remain include various underground and above ground piping, foundations, sealed and abandoned production or injection wells, and oilfield access roads. The current status of these features for Parcels 1 and 3 specifically is:

- Narrow oil-field roads were used to provide access to the former pumping and injection wells, pipelines, and tank settings. The current roads are in fair to poor condition, with encroaching vegetation growth. Although roads are limited in Parcels 1 and 3, road maintenance is performed as necessary to allow for site inspections;
- The oil wells were located on small flat-graded pads throughout the WCH property. Above ground oilfield equipment/structures have been removed and the primary way to identify the oil well/pad location is by finding the metal pole marking the abandoned well location. Access to the pads is limited by encroaching vegetation growth. Only one well was located on Parcel 1 and two wells were located on Parcel 3 (**Figure 3**);
- Power poles were present throughout the WCH property as part of the former electrical grid used to power the wellhead pumps. The transformers and wiring have been removed and soil samples have been collected at locations where pole-mounted transformers were present to test for potential PCB impacts. A PCB soil sampling assessment report for Parcels 1 and 3 was approved by the EPA and a No Further Action letter was issued (AECOM, 2020b).

1.2.2 Surrounding Area

The surrounding areas consist of residential and commercial properties, parks, water reservoirs, and open space. The Parcels 1 and 3 property is largely surrounded by properties within the City of Fullerton with limited areas adjacent to the City of La Habra and City of La Mirada. Multiple water reservoirs for the City of Fullerton and the City of La Habra are located along the northern and western WCH property boundaries. The Robert E. Ward Preserve is located immediately to the south.

Historical use of the surrounding sites included oil field operations (Emery Lease) and Chevron's WCH field offices to the west, and Chevron's Oil Field Research Facility to the north. From 1927 to 1951, the area north of the WCH property was primarily agricultural (ESE, 1995). By 1964, residential, commercial/light industrial, open space/parks associated with expansions of the City of Fullerton occurred in several directions around the WCH property. By 1975, residential development had occupied most of the land to the north. By 1986, residential development had occupied most of the land to the south. The surrounding land to the east and west was still being used for oilfield operations through at least 1986 before being converted to mixed residential/commercial/open space/park use similar to the uses to the north and south.

1.2.3 WCH Property History

Natural gas from the oil wells was processed at the Chevron Murphy-Coyote gas processing plant located in the southern central portion of the western WCH. The original plant was built in the 1920s and upgraded in 1972 and the late 1980s, before the plant was demolished in the 1990s. The processed gas was sent by pipeline to the Chevron refinery in El Segundo, California.

The Western and Eastern Properties of the WCH were transferred to PCH in the mid-1990s to prepare the WCH property for future development. By the late-1990s, nearly all the oil and gas wells had been abandoned (255 in total, with 195 on the Western Property, 49 on the Eastern Property, and 11 more within the adjacent Robert E. Ward Preserve); all wells were abandoned in accordance with the regulatory standard in place at the time of abandonment. Historical activities in Parcels 1 and 3 included the same types of oil field operations conducted in the rest of the WCH but were limited to only three oil wells (**Figure 3**).

1.2.4 Previous Remedial/Assessment Activities

Historical assessment and remediation activities were conducted within the WCH from June 1995 to January 2005 under the oversight of the OCHCA and/or the Santa Ana Regional Water Quality Control Board (SARWQCB). These included activities in Parcels 1 and 3. Impacted soils associated with former oil well locations, tank settings, historical operational sites, pipelines, and the natural gas processing plant have been identified in several areas located within the WCH property based on historical assessment activities. Historical (1995-2005) and current (2017-2019) soil data was submitted under a separate report (AECOM, 2020d).

Previous assessment activities have focused on soil impacts. Numerous project site geotechnical and environmental investigations and oil well logs have not detected continuous groundwater zones beneath the WCH Project Site up to the depth of investigation; occasional wet soils have been encountered but those are laterally discontinuous and limited in extent (AECOM, 2020d). Based on these data, groundwater is not considered to be an exposure pathway at the WCH property, and no groundwater remediation is proposed.

On March 1, 2005, a RAP (2005 RAP; BBL, 2005) was prepared for the WCH property as a whole and submitted to the OCHCA. The 2005 RAP summarized available WCH property data and identified several areas potentially requiring remediation. The preferred remedial alternative was soil excavation with beneficial reuse of impacted soil as on-site deep fill where possible or disposal to off-site regulated landfills as needed. The OCHCA approved the 2005 RAP on March 4, 2005.

From December 2017 to February 2018 a total of 51 soil samples were collected for PCB analysis; with ten detections ranging from 0.0036 mg/kg to 0.19 mg/kg In January 2002, a total of 10 samples were collected for PCB analysis within Parcels 1 and 3. All sample results (2002 and 2017-2018) reported PCB concentrations below the EPA regional screening level (RSL) of 0.23 mg/kg for residential soil and the applicable industrial RSL of 1.0 mg/kg. The 1.0 mg/kg industrial PCB RSL was approved for open space/trail areas in an email from George Randell, EPA Project Manager, on June 15, 2018 and confirmed by EPA Senior Regional Toxicologist, Dr. Patrick Wilson in an email dated June 19, 2018. Based on these data, no additional investigation or remediation for PCBs is required for Parcels 1 and 3 (AECOM, 2020b). In addition, a No Further Action declaration was issued by the EPA in an email dated June 17, 2020 from EPA to Chevron.

From October 2018 through April 2019, a total of 54 unique and four duplicate soil vapor samples were collected from 11 shallow (5-foot bgs) and seven deep (10 feet bgs) vapor probe wells installed throughout the WCH property. Two of the soil vapor wells were installed on Parcel 3. No soil vapor wells were placed on Parcel 1. A total of 11 soil vapor samples were collected from Parcel 3; three primary samples and one duplicate sample were collected from soil vapor well SV-1 and six primary samples and one duplicate sample were collected from soil vapor well SV-8 (**Appendix A**). The soil vapor samples were analyzed for VOCs over three events separated by a year and covering higher temperature summer conditions (October 2018 and October 2019) and lower temperature spring conditions (April 2019). Soil vapor samples were collected in accordance with OCHCA direction at prior locations where naphthalene and benzene had been detected in soil above EPA RSLs for future residential use. Soil vapor data collected over three separate events from 2018 to 2019 showed no detectable naphthalene and only limited detections of benzene and other VOCs consistent with the historical uses of the WCH property in general and Parcels 1 and 3 as a former oil field. None of the detected VOCs exceeded their respective risk-based screening levels (AECOM, 2020a; **Appendix A**).

1.2.5 Physical Setting and Topography

Parcels 1 and 3 are currently undeveloped and comprised of a varied landscape. The terrain is variable in elevation (USGS, 1981). The ground-surface elevation in Parcel 1 and 3 ranges from approximately 325 feet above mean sea level (msl) near Euclid Street on Parcel 1 to approximately 475 feet above msl near the southwest portion of Parcel 3.

1.2.6 Regional Geology and Hydrogeology

The Coyote Hills and adjacent lowlands are composed of Pleistocene age and younger units (Yerkes, 1972). Early Pleistocene marine strata of the San Pedro Formation are exposed throughout most of the northerly adjacent West La Habra property. In the West Coyote Oil Field, the San Pedro Formation consists of a light-colored layer of sand approximately 170 feet thick and an underlying dark-colored silty sandstone layer approximately 155 feet thick. The upper sand is massive, friable, and very coarse grained to pebbly with a clayey matrix. There are localized sandy conglomerate beds up to 15 feet thick. The Coyote Hills Formation, of older Late Pleistocene age, is exposed throughout the central and eastern portions of the properties, and consists of nonmarine massive sandstone, siltstone, conglomerate, and pebbly sandstone and is overlain unconformably by the younger Pleistocene La Habra Formation. The La Habra Formation, which is composed of floodplain deposits including siltstone, thick-bedded friable sandstone, pebbly sandstone, and conglomerate, generally does not exist within the properties and mantles the lower elevations of the perimeter of the WCH property (Yerkes, 1972; Tan and others, 1984). Alluvial and colluvial unconsolidated gravel, sand, and silt deposits occur in the drainages within the WCH property (Yerkes, 1972).

Hydrogeologically, the WCH property is located near the southern edge of the La Habra Basin, which is a gently down-warped trough bounded by the Puente Hills to the north and the West Coyote Hills to the south. Fresh-water-bearing sand and gravel beds separated by less

permeable layers of silt, sandy silt, or clay occur throughout the Pleistocene section of the basin; however, because the West Coyote Hills lie on the edges of the La Habra Basin, groundwater is not expected to be present, especially in the higher elevations, with some potential for perched groundwater within the drainage channels in the lower elevation portions of the western side of the WCH (Yerkes, 1972; AECOM, 2020c).

1.2.7 Special Environmental Resources and Site Sensitivity

The presence of special-status species located within one mile of the WCH property boundary (DTSC, 1996) was evaluated through a review of the California Department of Fish and Wildlife's (CDFW's) California Natural Diversity Database (CNDDB). For purposes of the CNDDB search, the WCH property coordinates were used to identify those species sighted within a mile of the WCH property. The CNDDB provides information on location, status and natural history of rare or endangered plants, animals, and habitats. The CNDDB is part of a nationwide network of natural heritage programs that is integrated with Geographic Information Systems and is maintained by the Habitat Conservation Division of the CDFW. Only actual sightings of species or species previously known to be present on a given site are recorded. The California Native Plant Society (CNPS) is a major contributor to the database, as well as universities and other users of the CNDDB.

Table A below summarizes all special-status species found within the La Habra Quadrant, within a 1-mile radius of the WCH property which include one plant, three birds, and one invertebrate.

Table A. Special-Status Species within a 1-mile Radius of the WCH Property

Species	Conservation Status	Rank	Habitat	Status Potential On-Site
Plants				
Coulter's goldfields *Lasthenia glabrata ssp. Coulteri*	Federal: None State: None	State: Imperiled (S2) State Rare Plant: Seriously threatened (1B.1)	Coast saltmarsh, playas, and vernal-pools	Unlikely present due to lack of habitat, and date last observed in the area (1935)
Birds				
Coastal cactus wren *Campylorhynchus brunneicapillus sandiegensis*	Federal: None State: Species of Special Concern	State: Vulnerable (S3)	Coastal sage scrub	**Present** - As many as 69 family groups on-site. Abundant quality cactus resources are present. (Keeton Kreitzer Consulting, 2008)
Coastal California gnatcatcher *Polioptila californica*	Federal: Threatened State: Species of Special Concern	State: Imperiled (S2)	Coastal sage scrub	**Present** – Most recent estimate of 66 pairs on-site, plus individuals, which is expected to fluctuate from year to year. Additional pairs have been detected on adjacent properties, some of which have been developed (Keeton Kreitzer Consulting, 2008; Dudek, 2016).
Bank swallow *Riparia*	Federal: None State: Threatened	State: Imperiled (S2)	Open lowland riparian areas near bodies of water	Unlikely present due to lack of habitat and date last observed in the area (1894)

Invertebrates				
Crotch bumble bee *Bombus crotchii*	Federal: None State: None	State: Critically Imperiled/Imperiled (S1S2)	Relatively warm and dry areas, from grasslands to scrub and from inner Coastal California to margins of Mojave Desert	Unlikely present due to date last observed in the area (1968).

Notes:
S1 = Critically Imperiled - Critically imperiled in the state because of extreme rarity (often ≤5 occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state.
S2 = Imperiled - Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state.
S3 = Vulnerable - Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.
1B.1 = Plants rare, threatened, or endangered in California and elsewhere; seriously threatened in California

The CDFW's most current *Special Animals List* and *List of State and Federally Listed Threatened and Endangered Animals* (CDFW, 2019 and 2018) were consulted to confirm the status designations. The status potential on-site for each species in the table was developed from observations made during an October 18, 2018 Site visit, the description of biological resources presented in the *Recirculated Revised Draft EIR, West Coyote Hills Specific Plan and Robert E. Ward Nature Preserve* (Keeton Kreitzer Consulting, 2008), the Final EIR and Addendum No. 1 to the Final EIR (Keeton Kreitzer Consulting, 2015), and a more recent biological survey focused on the California gnatcatcher (Dudek, 2016). Based on an evaluation of the habitat requirements of the special-status species listed above relative to the habitats present at Parcels 1 and 3, and in consideration of the dates these species were last observed in the area, only the two bird species, the California gnatcatcher and coastal cactus wren (*Campylorhynchus brunneicapillus*), are likely to occur at the Site.

To avoid and minimize impacts to these sensitive bird species, avoidance and mitigation measures will be implemented in connection with all activity and work to reduce the level of impact to critical habitat that could harbor these sensitive species. For example, any work or activity in the vicinity of occupied gnatcatcher habitat during nesting season (approximately February 15 to August 30) will comply with applicable United States Fish and Wildlife Service (USFWS) requirements and avoidance and mitigation measures to minimize the potential to impact California gnatcatchers and their critical habitat will be implemented. Exceedance locations where the destruction of critical habitat cannot be avoided will be permitted with the USFWS. In addition, avoidance and mitigation measures are prescribed to ensure that any potentially significant impacts on non-occupied or non-critical habitat of these species are eliminated or reduced to a less-than-significant level.

1.2.8 Risk Based Criteria Summary for Human Health - Soil and Soil Vapor

Potential exposure pathways at the Site could occur through impacted soil migration pathways that would primarily include air-borne transport as dust particles and water-borne transport both laterally and vertically through surface stormwater runoff or rainfall infiltration. Burrowing animals digging into impacted soils can cause physical expansion of a contaminated area by moving soil into new areas or loosening soil making it easier for air- or water-borne migration.

With respect to human receptors, and considering open space/trail use, the most likely potential human receptors for Parcels 1 and 3 will be people on the designated trail network, e.g., trail users and maintenance workers. Direct contact including incidental ingestion, dermal absorption, and dust inhalation are the exposure routes for soil.

Buildings are neither planned nor zoned for in Parcel 1 or 3, both of which are designated as open space with outdoor trails. As a highly conservative tool to assess potential soil vapor concerns,

soil vapor data were compared with vapor intrusion screening levels with results presented in **Appendix A**. Using DTSC (2011) Final Vapor Intrusion Guidance for a hypothetical future commercial building scenario and the recommended attenuation factor of 0.005 the soil vapor concentrations did not exceed their respective risk-based screening levels (**Appendix A**). At the request of OCHCA, soil vapor screening levels were also presented using the DTSC (2020) draft attenuation factor of 0.03. Based on the more conservative screening that utilizes a generic attenuation factor, there are exceedances for PCE under a commercial scenario and exceedances for PCE, chloroform, and hexachlorobutadiene under a residential scenario. The USEPA derived a “generic” attenuation factor of 0.03 based on its empirical database that did not discriminate between residential and commercial buildings nor regional climate differences. It should be noted that the exceedance for PCE and hexachlorobutadiene were solely from the mobile lab analyses which have been shown to be inconsistent between sampling periods and not corroborated by the Fixed Lab/Summa data. These data suggest that residual VOC impacts to soil vapor are generally low and not expected to pose an unacceptable risk to human health during future remedial excavation activities. However, excavations will be monitored for fugitive VOCs in accordance with SCAQMD Rule 1166 and dust suppression methods will be conducted in accordance with SCAQMD Rule 403. Laboratory data for soil vapor samples collected from 2018 to 2019 at soil vapor wells SV-1 and SV-8 located in Parcel 3 are provided in **Appendix A**.

Laboratory data for soil vapor samples collected from 2018 to 2019 for the entire WCH property are available in AECOM’s *Soil Vapor Sampling Report - West Coyote Hills, Fullerton, CA* submitted to OCHCA on April 10, 2020.

A summary of analytes exceeding the soil cleanup criteria is provided in **Table 2** and described in detail in **Section 2.3**.

2. Remedial Action Plan

This section describes the field screening process and the methods that will be used during the remedial activities. The daily field activities will be conducted under the supervision of the construction manager. Sampling activities will be conducted in accordance with the Quality Assurance Project Plan (QAPP; AECOM, 2020e).

2.1 Data Processing for Risk-Based Screening

The focus of this risk-based screening is on human and ecological exposures to soils in Parcels 1 and 3. **Table 1** identifies the selected final screening level for each analyte detected at the Site. **Table 2** presents the summary of all locations exceeding the established soil cleanup criteria that are subject to remediation (**Section 1.1**). **Tables 3 and 4** present the initial comprehensive soil data screening that was conducted as a first step to identifying sample locations that exceed the selected screening levels regardless of sample depth or location, and the locations identified in these tables were further refined with the cleanup criteria in **Table 2**. All detected analytes were included in the initial screening evaluation presented in **Tables 3 and 4**, and specific data handling processes and data evaluation methods were needed for certain chemical classes, as described below.

Wet Weight to Dry Weight Conversion

The project data set includes sample concentrations expressed on both a wet and dry weight basis. For the results reported on a wet weight basis, it was necessary to convert wet weight concentrations (ConcWW) to dry weight concentrations (ConcDW) in order to create a soil data set consistent with and comparable to the regulatory screening levels that were applied (e.g., EPA RSLs and EPA EcoSSLs), which are expressed as dry weight concentrations. The following formula is used for this conversion:

〖Conc〗DW = 〖Conc〗WW × (100)/(100- percent moisture)

This formula can be further simplified by expressing the latter part of the equation as follows:

(100)/(100 - percent moisture) = solids fraction

A sample by sample summary of the datasets for Parcels 1 and 3, including wet weight concentrations, moisture and solids content, and the dry weight concentrations resulting from the adjustment using the solids fraction is provided in **Appendix B**. This conversion was performed to avoid underestimating exposure point concentrations (EPCs); that is, the concentrations at the point of contact with the receptor, as chemical concentrations increase upon conversion from a wet weight basis to a dry weight basis.

Percent moisture data were not available for all soil samples in the dataset. Moisture data were reported for samples analyzed for PCBs, and therefore, the wet weight concentrations reported for the other sample analytes were adjusted to dry weight using the sample-specific moisture (solids) data. In the absence of sample-specific moisture data, moisture data from all samples within each individual parcel were compiled and applied as the default moisture content. Specifically, the 95% upper confidence limit on the mean (95UCL) was calculated with the available moisture and solids data for Parcels 1 and 3 and applied to wet weight concentrations to predict the associated dry weight concentration using EPA's latest ProUCL software tool Version 5.1 (EPA, 2016). The 95UCLs for the solids data collected from both parcels is essentially the same at 95% (or 0.95, i.e., very low moisture content).

TPH

The ecological assessment of TPH as complex chemical mixtures (e.g., gasoline, diesel) is highly uncertain with regards to the actual chemicals present, especially for aged, weathered forms like

those present at the Site. For purposes of ERAs, often the most toxic constituents associated with these mixtures comprise the focus of the assessment, i.e., PAHs, SVOCs, and VOCs, referred to as indicator chemicals for TPH (San Francisco Bay RWQCB, 2019; Total Petroleum Hydrocarbon Criteria Working Group, 1997). If the outcome of the ecological risk screening for these indicator chemicals demonstrates a potential for risk, then site TPH data for mixtures (e.g., diesel, gasoline) and/or fractions is often considered in conjunction with the indicator data to assess the potential extent of impacts. For purposes of the Parcels 1 and 3 RAP, the TPH chemical indicator approach was considered in conjunction with the use of the San Francisco Bay RWQCB Environmental Screening Levels (ESLs) for TPH in soil presented for ecological receptors (2019).

PAHs

PAHs were evaluated in accordance with EPA's EcoSSLs guidance (EPA, 2007), which recommends analyzing this chemical class as low molecular weight PAHs (LPAHs) and high molecular weight PAHs (HPAHs) based on their differing characteristics that influence environmental persistence, fate and transport, bioaccumulation, and ecological toxicity. LPAHs are acutely toxic but tend not to persist in the environment for extended periods of time due to biodegradation and weathering (primarily by volatilization), while HPAHs are known to persist and have the potential to bioaccumulate and/or induce chronic effects (EPA, 2007). Therefore, PAHs were evaluated as summations (i.e., LPAHs and HPAHs) and individual compounds (for completeness only), but emphasis was placed on the findings for LPAHs and HPAHs consistent with EPA's methodology.

To calculate these summations for samples in which all individual PAHs were detected, the detected results were added to generate total LPAHs or total HPAHs for that sample. In the case of individual PAH results that are non-detect (ND), the method detection limit (MDL) for that result was included in the summation for that particular sample. If all individual PAH results were ND for a sample, the sum of all MDLs for the individual PAHs was reported as the ND (U-flagged) result for that sample.

PCBs

PCB Aroclors were evaluated as total PCBs calculated as the sum of Aroclors per sample. Aroclors 1254 and 1260 are the only two PCB mixtures detected in open space soil and, therefore, sample-specific results for these two Aroclors were summed. In samples for which one of these Aroclors is ND, the MDL was used in the summation. If both results were ND, the highest MDL was identified as the proxy for that sample.

As described in **Section 1.2.4** above, all of the sample results from samples collected from December 2017 to February 2018 had PCB concentrations below the EPA RSL of 0.23 mg/kg for residential soil and the applicable industrial RSL of 1.0 mg/kg. The 1.0 mg/kg industrial PCB RSL was approved for open space/trail areas by the EPA.

Dioxins/Furans

Dioxins/furans were evaluated as 2,3,7,8-TCDD TEQs. These summations were calculated based on the individual dioxin/furan congeners and their relative toxicity to the most toxic compound for that group (i.e., 2,3,7,8-TCDD). Other dioxin/furan congeners are found to be equally to substantially less potent, relative to TCDD (Van den Berg et al., 1998; EPA, 2008). The calculation involves multiplying the congener-specific individual compound-specific data by toxicity equivalency factors (TEFs) for birds and TEFs for humans/mammals, which are measures of the relative toxicity of each congener compared to 2,3,7,8-TCDD, to derive individual dioxin/furan congener toxicity equivalency (TEQ) concentrations. The calculated individual dioxin/furan congener TEQ concentrations are then summed per receptor group to calculate the 2,3,7,8-TCDD TEQ – birds and the 2,3,7,8-TCDD TEQ – humans/mammals' concentration, respectively, for each sample. The most current TEFs published by the World Health Organization for dioxins/furans were applied (Van den Berg et al. 1998, 2006, EPA, 2008). All detected dioxin/furan

isomers were included in the sample-specific summations using the same process to manage NDs as described above for total PCBs.

2.2 Summary of Remedial Criteria

The following provides a summary of the selected risk-based screening levels and the established soil cleanup criteria that will be applied during this environmental remediation project. The analytes that have been detected at concentrations exceeding screening levels (and background levels of metals) within Parcels 1 and/or 3 are arsenic, barium, chromium (total), lead, mercury, vanadium, 2,3,7,8-TCDD TEQ Mammals, total HPAHs, TPHg, TPHd, TPHmo, naphthalene, and phenanthrene (**Table 2**). Exceedances deeper than 2 feet bgs for human health and deeper than 6 feet bgs for ecological health were not included in this remedial action plan as these exceedance points are at depths not readily available for direct contact by human or ecological receptors, respectively (see **Sections 1.1, 2.2.1.2, and 2.2.2.1** for the established soil cleanup criteria). A summary of the final screening level selected for each analyte is provided in **Table 1.**

Upon evaluation of the locations exceeding human health and/or ecological screening levels (and background levels for metals), the final cleanup levels were selected as follows:

Locations Within Trail Boundaries

- ***0 to 2 feet bgs -*** Human health screening level is applicable. For metals with human health screening levels less than the background level, the background level is applicable.
- ***> 2 feet bgs -*** Not recommended for remediation – likelihood of human exposure is very low.

Locations Outside of Trail Boundaries

- ***0 to 2 feet bgs -*** Lower of human health screening level and ecological screening level multiplied by a factor of 4.0 (i.e., Eco HQ = 4.0) is applicable. For metals, when the selected risk-based cleanup level is less than the background level, the background level is applicable.
- ***2 to 6 feet bgs -*** Ecological screening level multiplied by a factor of 4.0 (i.e., Eco HQ = 4.0) is applicable. For metals with ecological cleanup levels less than the background level, the background level is applicable.
- ***6 feet bgs -*** Not recommended for remediation – likelihood of human exposure is very low and depth exceeds the zone for burrowing animals, greatly reducing the potential for ecological exposures to occur.

The final cleanup levels established for Parcels 1 and 3 are provided in **Tables 2A and 2B**.

Soil sample concentrations were compared to the human health and ecological screening levels for detected analytes at Parcels 1 and 3 are presented below as **Tables 3 and 4**, respectively.

2.2.1 Ecological Screening Levels

The selected ecological screening levels for soil are presented in **Table 5** and reflect the following hierarchy: EPA's EcoSSLs (2005-2008), Los Alamos National Laboratory's (LANL's) Ecorisk database (2017), and Oak Ridge National Laboratory sources (Efroymson, et al. 1997a, 1997b, and 1997c). EPA's EcoSSLs for plants, soil invertebrates, birds, and mammals were selected as the primary source of screening levels whenever available (EPA 2005-2008). The lowest EcoSSL of these four main terrestrial receptor groups represents the final EcoSSL. The EcoSSLs reflect sensitive endpoints under high bioavailability scenarios and are intentionally designed as generic, conservative screening levels (SLs) that are not recommended for use as cleanup levels. Many EcoSSLs for metals, for example, are less than naturally occurring background concentrations.

EPA's EcoSSLs are applied widely in Environmental Risk Assessments (ERAs) conducted in California, and in the absence of an EcoSSL, other reliable sources were consulted, i.e., Los Alamos National Laboratory (LANL, 2017) was selected secondarily in the hierarchy, followed by Oak Ridge National Laboratory sources (Efroymson, et al. 1997a, 1997b, and 1997c). For TPH, the San Francisco Bay RWQCB's ESLs for ecological receptors (2019) were applied at OEHHA's request.

2.2.1.1 Application of Ecological Screening Levels and Background Levels

The selected ecological soil screening levels were compared to the dry weight datasets for each parcel on a point by point basis in **Tables 3 and 4**. A summary of the points that exceeded both the ecological screening levels and the established soil cleanup criteria are presented in **Table 2**. In addition to the risk-based screening levels, concentrations of metals were also compared to regional background soil concentrations to reflect the fact that soils at the Site will ultimately not be remediated to levels below naturally occurring background levels. Background metals concentrations are represented by the 95th percentile for soil data collected at various air force bases in California presented in Hunter et al. (2005).

The following analytes have concentrations greater than the ecological soil screening levels and/or background levels (metals only) based on a screening of the entire soil dataset for each parcel regardless of sample depth or location (**Tables 3 and 4**):

Parcel 1

- Barium, lead, naphthalene, TPHd, TPHmo, 2,3,7,8-TCDD TEQ Mammals

Parcel 3

- Arsenic, barium, chromium (total), lead, mercury, vanadium, 2,3,7,8-TCDD TEQ Mammals, total HPAHs, TPHg, TPHd, TPHmo, acenaphthene, naphthalene, and phenanthrene.

As stated previously, more confidence is placed in EPA's EcoSSL methodology, which recommends evaluating PAHs as two groups (LPAHs and HPAHs), relative to other approaches that entail a comparison to screening levels for individual PAHs (e.g., LANL and ORNL). Therefore, even though naphthalene and phenanthrene exceeded the LANL screening levels for these individual LPAHs in a few samples, they are most appropriately evaluated grouped as Total LPAHs (EPA 2005-2008). As shown in **Tables 3 and 4**, there are no exceedances of the EPA EcoSSL for Total LPAHs at either parcel. However, the two samples with individual LPAHs exceeding the LANL screening levels (naphthalene in EG-131-5 and naphthalene and phenanthrene in MC-145-PH-6) are recommended for remedial excavation due to the elevated detections of TPHd at both locations, as well as Total HPAHs at MC-145-PH-6 (**Section 2.3**).

Figures 4 and 5 illustrate the locations with concentrations of the analytes listed above in exceedance of the ecological screening levels for soils between 0 and 6 feet bgs. DTSC recommends using soil samples collected from 0 to 6 feet bgs to estimate exposure for burrowing mammals at a screening level (DTSC, 1998), and this exposure depth interval was conservatively assumed to apply to all ecological receptors and pathways (see **Section 2.4.1** for additional discussion). The ecological screening levels are presented in the legend of each figure, and the regional background levels for metals (Hunter et al., 2005) are shown as the default screening level for analytes with a risk-based screening level that is less than the background level.

2.2.1.2 Application of Ecological Cleanup Criteria

The final step in the ecological screening process was to evaluate the sample locations in exceedance of the ecological screening levels in light of the soil cleanup criteria approved by OCHCA and OEHHA (**Section 1.1**). The approved ecological cleanup criteria prompt remedial excavation for all sample locations that meet the following requirements:

- Exceed ecological screening levels at depths between 0 to 6 feet bgs;
- Exceed ecological screening levels in the open space areas only, exclusive of trails (not considered viable habitat). Trail boundaries are defined by the trail easement;
- Locations that meet the ecological criteria above and have an Eco HQ ≥ 4.

The locations identified for remedial excavation are provided in **Table 2**.

2.2.2 Human Health Screening Levels

The designated use for Parcels 1 and 3 is for open space/trails and human receptor exposures will be screened using the commercial/industrial screening levels. All human exposures are assumed to be at or around the trails; thick foliage and ecological protection concerns are expected to discourage regular movement by trail receptors in most of the open space. Although the human receptors are trail users and trail maintenance workers with relatively short exposure times at any one location, the human health risk-based screening levels were conservatively based on standard commercial/industrial worker exposure parameters which assume exposure for 250 days a year for 25 years exposure duration. The following state and federal promulgated Human Health screening levels were considered to evaluate the laboratory soil data at the Site:

- DTSC (2020) HHRA Note 3, DTSC-modified Screening Levels for Commercial/ Industrial Soil;
- EPA (2020) RSLs for Commercial/Industrial Workers;
- TPH only: petroleum products (e.g., gasoline [TPH-g], diesel [TPH-d], and motor oil [TPH-m]) were screened to OCHCA required criteria;
- Metals that exceeded health criteria were also compared to background (Hunter et al., 2005). Metals that exceeded both health criteria and background were identified for remedial consideration;
- Similar to the ecological process, dioxins/furans utilized the TEQ methodology described above but only used human/mammal TEFs;
- PAHs were screened based on individual analyte detections and screened to their respective health-based criteria. The B(a)P-eq was calculated and screened to benzo(a)pyrene health-based criteria as supplemental information.

2.2.2.1 Application of Human Health Screening Levels and Soil Cleanup Criteria

The selected human health soil screening levels were compared to the dry weight datasets for each parcel on a point by point basis in **Tables 3 and 4**. The following analytes have concentrations greater than the human health soil screening levels and/or background levels (metals only) based on a screening of the entire soil dataset for each parcel regardless of sample depth:

Parcel 1

- TPHd and TPHmo

Parcel 3

- TPHg, TPHd, TPHmo, naphthalene, and arsenic

The final step in the human health screening process was to evaluate the sample locations in exceedance of the human health screening levels using the soil cleanup criteria approved by OCHCA and OEHHA (**Section 1.1, Table 2**). For human health, the criterion established defines the maximum depth of human exposures on the trails as 2 feet bgs. Although unlikely and intermittent, trail receptors may go off trail and into open space; therefore the human health criteria were applied to the entire site to identify all exceedances. **Figures 4 and 5** depict the locations

with concentrations of the analytes listed above in exceedance of the human health screening levels for soils between 0 and 2 feet bgs within Parcels 1 and 3. Within a depth range of 0 to 2 feet bgs, there were two locations with exceedances identified in Parcel 1 and four locations in Parcel 3, which are described in the following section.

2.3 Cleanup Criteria Evaluation

Based on the evaluation of the soil data compared to the human health and ecological screening levels (**Figures 4 and 5**) and subsequent application of the approved soil cleanup criteria, a total of twelve (12) locations in Parcels 1 and 3 were identified for remedial action (**Figures 6 and 7**). Four of these locations are in Parcel 1 and the remaining eight in Parcel 3. Tables B and C below summarize the relevant information for each location with a human health and/or ecological exceedance when compared to the cleanup criteria.

Table B. Parcel 1 Locations Exceeding Cleanup Criteria

Location ID	Sample Depth (feet)	Analyte Exceeded	Concentration (mg/kg)	Human Health Discussion	Ecological Discussion	Final Criteria Exceeded	Removal Proposed (Yes/No)
EG-73	1	Barium	560	Not a Human Health Exceedance	-Eco HQ ≥ 4.0 for 2,3,7,8-TCDD TEQ Mammals. -Barium Eco HQ < 4.0.	Eco	Yes
	1	Barium	745				
	1	2,3,7,8-TCDD TEQ Mammals	3.10E-06				
EG-127	0	2,3,7,8-TCDD TEQ Mammals	1.46E-06	Not a Human Health Exceedance	- Eco HQ ≥ 4.0 for 2,3,7,8-TCDD TEQ Mammals. Lead exceeded background level, but Eco HQ < 4.0.	Eco	Yes
	0	Lead	28.3				
EG-131	5	TPHd	4,880	Exceeded Human Health criteria for TPHd and TPHmo, however the exceedance depth is deeper than 2 feet bgs.	- Eco HQ ≥ 4.0 for TPHd.	Eco	Yes
	5	TPHmo	6,070				
EG-134	0	TPHmo	12,600	Exceedance Human Health criteria for TPHmo.	- Eco HQ ≥ 4.0 for TPHmo.	HH	Yes

Only Ecological Exceedances from 0-6 feet bgs with an Eco HQ ≥ 4.0 and Human Health Exceedances between 0-2 feet bgs are displayed

Table C. Parcel 3 Locations Exceeding Cleanup Criteria

Location ID	Sample Depth (feet)	Analyte Exceeded	Concentration (mg/kg)	Human Health Discussion	Ecological Discussion	Final Criteria Exceeded	Removal Proposed (Yes/No)
EG-055	5	Chromium	52.1	Not a Human Health Exceedance	Eco HQ ≥ 4.0 for Vanadium. Chromium Eco HQ < 4.0.	Bck	Yes
	5	Vanadium	213				
EG-085	0	2,3,7,8-TCDD TEQ Mammals	1.65 E-06	Not a Human Health Exceedance	Eco HQ ≥ 4.0 for TCDD TEQ Mammals	Eco	Yes
MC-079-4	5	2,3,7,8-TCDD TEQ Mammals	1.33 E-06	Not a Human Health Exceedance	Eco HQ ≥ 4.0 for TCDD TEQ Mammals	Eco	Yes
MC-145-2	0	Arsenic	21	- Exceeded human health criteria for arsenic.	Arsenic exceeded the background level, but Eco HQ < 4.0.	Bck	Yes
	0	Arsenic	17.9				
MC-145-3	0	Mercury	0.673	Not a Human Health Exceedance	Eco HQ ≥ 4.0 for mercury and background level exceeded.	Bck	Yes
	0	Mercury	3.58				
MC-145-4	0	2,3,7,8-TCDD TEQ Mammals	1.77 E-05	- Exceeded human health criteria for arsenic.	Eco HQ ≥ 4.0 for TCDD TEQ mammals and arsenic. Both arsenic and lead exceeded the background level, but lead Eco HQ < 4.0.	Eco/ Bck	Yes
	5	2,3,7,8-TCDD TEQ Mammals	5.88 E-06				
	0	Arsenic	75.7				
	0	Arsenic	158				
	1	Arsenic	23.1				
	1	Arsenic	20				
MC-145-5	1	TPHmo	2,630	- Exceeded human health criteria for TPHmo.	Eco HQ < 4.0 for TPHmo.	HH	Yes
MC-145-PH	3	TPHd	3,890	- Exceeded human health criteria for TPHd and TPHmo, however the exceedance depth is below 2 feet bgs.	Eco HQ ≥ 4.0 for TPHd, Total HPAHs, and naphthalene.	Eco	Yes
	6	TPHd	13,700				
	6	Total HPAHs	6.57				
	6	Naphthalene	7.89				
	6	Phenanthrene	8.62				

Only Ecological Exceedances from 0-6 feet bgs with an Eco HQ ≥ 4.0 and Human Health Exceedances between 0-2 feet bgs are displayed.

2.4 Proposed Remedial Excavation Locations

There is a total of twelve (12) locations in Parcels 1 and 3 with samples containing historically (1995-2005) and/or currently (2017-2019) detected concentrations that exceed either or both the human health and ecological screening levels and the final cleanup criteria (**Section 2.3**; **Table 2**). Four of the locations with exceedances are in Parcel 1 and eight locations are in Parcel 3.

It should be noted that a preliminary biological assessment and evaluation of access routes has been conducted for these proposed locations and the potential exists for conflicts with the protection of critical habitat required by the USFWS. Details of the locations considered for remedial excavation are described below. The exceedance locations considered for remedial excavation and general confirmation sampling plan are depicted on **Figures 6 and 7**.

Parcel 1

- **EG-073** – Located in Coastal Sage Scrub in the northwest corner of Parcel 1. Current 2,3,7,8-TCDD TEQ Mammals detections exceed the Eco HQ cleanup criteria at 1-foot bgs at this location.
- **EG-127** – Located in Coastal Sage Scrub in the southeast portion of Parcel 1. Current 2,3,7,8-TCDD TEQ Mammals detections exceed the Eco HQ cleanup criteria at the ground surface at this location.
- **EG-131** – Located in Coastal Sage Scrub in the eastern portion of Parcel 1. Current TPHd and TPHmo detections exceed human health screening criteria and the Eco HQ cleanup criteria at 5-feet bgs at this location.
- **EG-134** – Located in Coastal Sage Scrub in the southeast portion of Parcel 1. Current TPHmo detections exceed human health screening criteria and the Eco HQ cleanup criteria at the ground surface at this location.

Parcel 3

- **EG-055** – Located in disturbed Coastal Sage Scrub in the southern portion of Parcel 3. Current chromium and vanadium detections exceed the Eco HQ cleanup criteria at 5-feet bgs at this location.
- **EG-085** – Located in Coastal Sage Scrub in the eastern portion of Parcel 3. Current 2,3,7,8-TCDD TEQ Mammals exceed the Eco HQ cleanup criteria at the ground surface at this location.
- **MC-079-4** – Located in Coastal Sage Scrub in the eastern portion of Parcel 3. Current 2,3,7,8-TCDD TEQ Mammals detections Eco HQ cleanup criteria at 5-feet bgs at this location.
- **MC-145-2** – Located in Coastal Sage Scrub in the southeast portion of Parcel 3. Current arsenic detections exceed background levels and human health cleanup criteria at the ground surface at this location.
- **MC-145-3** – Located in Coastal Sage Scrub in the eastern portion of Parcel 3. Current mercury detections exceed background levels and Eco HQ cleanup criteria at the ground surface at this location.
- **MC-145-4** – Located in Coastal Sage Scrub in the eastern portion of Parcel 3. Current 2,3,7,8-TCDD TEQ Mammals detections exceed Eco HQ cleanup criteria at 5-feet bgs at this location. Arsenic concentrations exceed background levels and human health and Eco HQ cleanup criteria at the surface, and at 3-feet bgs the background level and human health cleanup criteria are exceeded.
- **MC-145-5** – Located in Coastal Sage Scrub in the eastern portion of Parcel 3. Current TPHmo detections exceed human health cleanup criteria at 1-foot bgs at this location.

- **MC-145-PH** – Located in Coastal Sage Scrub in the southeast portion of Parcel 3. Current TPHg, TPHd, Total HPAHs, naphthalene, and phenanthrene detections exceed human health and/or Eco HQ cleanup criteria at 6-feet bgs at this location. An additional TPHd detection exceeded human health and Eco HQ cleanup criteria at 3-feet bgs.

2.4.1 Remedial Excavation Activities

The scope of the proposed remedial excavations in Parcels 1 and 3 is described in **Section 2.4** and will include the following general activities:

- Removal of any overlying hardscape/asphaltic material on the surface.
  - This material will be stockpiled and, if determined suitable for use as base material in excavations/low-lying areas, will be crushed on-site. Otherwise, this material will be loaded into transport trucks for off-site disposal;
- Excavation depths will be approximately 1-foot below detected soil impacts exceeding the screening criteria;
- The diameter of the excavation boundaries and excavation method for the locations depicted on **Figures 6 and 7** will be determined on a site-specific basis and based on confirmation sampling results at each location;
  - Excavations will be sloped or benched from the center (deepest point) or will be shored if benching or sloping is not performed;
- Excavation areas will be made to adjust the final grade to better manage stormwater flows;
- If confirmation sampling results exceed the cleanup criteria additional sampling will be conducted as described in **Section 3.1.1** below;
  - Excavations for soil removal will follow the following procedures:
  - Soil disturbed in the cut areas will be scanned with a field photoionization detector (PID) for volatile vapors greater than 50 ppmv in accordance with SCAQMD Rule 1166, and with an x-ray fluorescence (XRF) field detector for the presence of arsenic greater than 11 mg/kg. Soil exceeding these screening criteria will be addressed as noted in **Section 3.0**.

Dust control measures will be conducted as described below in **Section 3.6**.

2.5 Pre-Field Activities

2.5.1 Permitting and Health and Safety

A grading permit will be obtained from the Orange County Department of Public Works (OCDPW) and City of Fullerton for a total excavation volume of 50 cubic yards of soil or more. The required documents include a cover letter describing the anticipated work, a scaled location map, a set of site plans including basic surface contours along with the proposed excavation limits, the planned waste facility that will be receiving the excavated soil, and a copy of the Health and Safety Plan. Backfill activities will be conducted in accordance with the grading permit. All activities will be conducted in accordance with the Construction General Storm Water Permit administered by the State Water Resources Control Board (SWRCB), including the preparation of a Stormwater Pollution Prevention Plan (SWPPP), unless the project qualifies for a waiver due to the limited area of disturbance. Best management practices (BMPs) will be implemented prior to conducting subsurface digging activities.

All excavation activities will be performed in accordance with SCAQMD Rule 403 and 1166 guidelines for dust and VOC emissions, respectively. The required monitoring will be performed while excavating and handling TPH or VOC-impacted soil (i.e., defined as 50 parts per million by volume [ppmv] or greater in vapor measured at the soil surface) at the Site.

While not currently anticipated, if an underground pipe with a coating or other oil field feature that is subsequently determined to contain asbestos is encountered, the SCAQMD will be notified in accordance with Rule 1403 and appropriate abatement plans will be prepared prior to removing the piping.

The health and safety plan (HASP) will be updated for the proposed excavation activities and followed by Site personnel during the remediation activities.

2.5.2 Utility and Biological Clearance

As required by California state law, Underground Service Alert of Southern California (USA) will be contacted a minimum of three working days before initiating fieldwork. Prior to contacting USA, the excavations will be delineated with white spray paint thereby outlining the proposed limits of subsurface work. A ticket number will be obtained to request utility clearance by parties with underground utilities in the areas. Following notification, utility owners or their representatives will mark the approximate location of each subsurface utility. Prior to conducting subsurface fieldwork, each location will be visually inspected and surveyed by geophysical methods to assess potential buried conflicts.

The federally-listed California gnatcatcher and other sensitive species are present within Parcels 1 and 3 (**Section 1.2.7**). Field activities will include measures to avoid potential adverse effects on the gnatcatcher and its associated coastal sage scrub habitat, with prior notification to and coordination with the USFWS if required. Any work that is limited to former facility roads that are not currently considered as part of the WCH habitat area are not anticipated to require biological clearances. However, the requirement for biological clearances will be evaluated at each work location prior to initiating any work activities that could potentially cause disturbance to any federally listed endangered species or their habitat.

2.6 Soil Excavation

Impacted soil will be excavated from each of the proposed excavation areas listed in **Section 2.4.1** above and as depicted on **Figures 6 and 7.** The COPCs in soil (TPH, 2,3,7,8-TCDD TEQ, arsenic, barium, lead, and mercury) have been determined based on soil analytical data provided in previous reports (AECOM, 2020b; AECOM, 2020d). During the excavation activities the excavated area will be screened using a PID to detect TPH impacts and an XRF detector to detect metals. The soil will be excavated and removed until screening methods indicate that impacts to soil are no longer observed above action levels at which point confirmation sampling will be conducted as described in **Section 3.0**. Additional vertical and/or lateral excavation work may occur based on laboratory data from confirmation soil samples collected from each exceedance location subsequent to the initial excavation and as supported by PID or XRF field screening methods.

2.6.1 Excavation and Soil Handling Methods

Prior to any excavation, the approximate horizontal extent of the impacted soil areas will be marked using stakes or marking paint to facilitate the excavation process. Conventional construction equipment, such as a small excavator or backhoe, will be used to excavate the soil. Additional vertical excavation will be conducted depending on the subsequent soil confirmation sampling results (**Section 3.0**). Additional lateral excavation will be evaluated based on field and laboratory confirmation data and may require a USFWS permit.

Shoring or sloping of the sidewalls during excavation, if required, will be conducted as needed in accordance with the U.S. Occupational Safety and Health Administration (OSHA) 29 Code of Federal Regulations (CFR) 1926 requirements. Under no circumstances will any field personnel be allowed to enter an excavation deeper than 4 feet bgs that is not appropriately benched, sloped, or shored.

For health and safety purposes and within a reasonable timeframe upon completion of the remedial action and with approval from OCHCA, the City of Fullerton, and OCDPW, it is anticipated that the excavated areas will be backfilled and compacted with clean imported soil, crushed hardscape/asphaltic base, or on-site soil approved as acceptable fill. Backfill will be compacted as required by the grading plan.

The excavations will be monitored for fugitive VOCs in accordance with SCAQMD Rule 1166. Field personnel will measure vapor concentrations 3-inches above the disturbed soil with a PID calibrated daily against a known vapor standard (i.e., 100 parts per million [ppm] hexane) in accordance with manufacturer specifications as documented by field personnel in the field reports. Measurements will be made every 15 minutes while work is being conducted. If detected vapor concentrations exceed 50 ppmv, SCAQMD will be notified and a various locations VOC mitigation plan for the soil with elevated VOC vapors will be implemented in accordance with the Rule 1166 permit.

2.6.2 Soil Stockpiling and Profiling

Excavated soil will be either direct loaded into transport trucks for off-site disposal where feasible or transferred and temporarily stockpiled in an on-site staging area prior to off-site transport. The recommended soil disposal facility is identified in **Section 4.1.1**.

2.6.3 Excavation Survey

Upon completion of the excavations and prior to backfilling, the excavated grade will be surveyed by a licensed surveyor to confirm that the targeted excavation extent and depths have been achieved.

2.6.4 Backfill Activities

Backfill activities will occur as part of the geotechnical grading activities associated with the excavation activities. The excavations will be backfilled with WCH soil that has been pre-screened under the soil assessment sampling program as meeting screening criteria or by imported clean soil where surface elevations need to be further raised to meet grading plan requirements. Backfill will be conducted in accordance with an approved grading permit under the supervision of a California Professional Geotechnical Engineer.

2.7 Dust Control Measures

Dust suppression in accordance with the SCAQMD Rule 403 for fugitive dust emissions will be performed by lightly spraying the work areas with water. A light mist may also be used on soil placed within the transport trucks. After the soil is loaded into the transport trucks, the soil will be covered to prevent soil from spilling out of the truck during transport to the disposal facility. When needed, truck exterior areas will be brush cleaned to remove soil prior to leaving the Site. In addition, corrugated steel plates will be placed near the exits to prevent soil being tracked offsite.

The Site is secured with fencing, which reduces the potential for unauthorized personnel to enter the excavation areas. If precipitation exceeding ½-inch in a day is anticipated, the bottom of any active excavation that may still contain impacted soil for removal will be covered with polyethylene sheeting to collect rainwater. Collected rainwater will be pumped from the excavation and

transferred to an aboveground storage tank. Impacted water will be sampled and disposed of in accordance with federal, state, and local regulations.

While on the property, all vehicles will maintain slow speeds (i.e., less than 15 miles per hour) for safety purposes and for dust control measures. Efforts will also be made to minimize the soil drop height from the excavator's bucket into the transport trucks.

Airborne dust monitoring will be conducted using a portable dust monitor to verify and document dust suppression efforts. Fugitive dust control measures will be implemented as appropriate to mitigate off-site dust migration onto neighboring properties by lightly watering the active excavation areas throughout the remedial action. Factors considered in providing fugitive dust control measures include wind direction, speed monitoring, dust control, and dust suppression.

Air monitoring for dust will be performed during the excavation activities in the worker's breathing zone, at the perimeter of the exclusion zone, and at the perimeter of the Site using an upwind and downwind sampling approach. Dust monitoring will be conducted approximately every hour, or as often as every 15 minutes if visible dust is observed, using a hand-held dust meter. The National Ambient Air Quality Standard (NAAQS) for dust is 50 micrograms per cubic meter (µg/m^3), based on dust particles measuring 10 micrometers or less (PM10). The NAAQS dust standard (50 µg/m^3), steady for 5 minutes, has been selected as the action level for dust monitoring activities at the perimeter of the property. The action level for dust for the equipment operators and workers will initially be set at 5 milligrams per cubic meter (mg/m^3) steady for 5 minutes. Respiratory protection will be worn by the equipment operators if dust levels exceed 2 mg/m^3, but are less than 5 mg/m^3, for more than 5 minutes.

2.8 Disposal Volumes

Based on the locations considered for remedial excavation it is anticipated that up to 70 transport truckloads may be needed to haul impacted soil from the Site assuming the excavated soil does not meet requirements for use as deep fill. This estimate is based on each truckload weighing up to 23 tons (i.e., 15 cubic yards) with a maximum estimated volume of 1,043 cubic yards of impacted soil to be removed from the Site. Truckloads for excess crushed hardscape/asphaltic materials that need to be disposed off-site will depend on the final volume of excess material.

2.9 Excavation Closure Report

Approximately 8 weeks after excavation and backfill activities are completed, a closure report will be prepared and submitted for agency review. Final excavated soil and hardscape/asphaltic volumes disposed off-site, confirmation data, compaction results, and figures showing excavation boundaries will be included in the report.

3. Confirmation Sampling and Analysis Plan

The confirmation sampling program for the proposed remedial action will consist of collecting surface soil samples along the excavation side walls and base for field screening and laboratory analysis as detailed in the following sections. These data will then be used to verify that the excavations meet the remedial objectives and follow recommendations outlined in the Quality Assurance Project Plan (QAPP; AECOM, 2020e). This approach will be applied to the identified excavations depicted on **Figures 6 and 7**. If additional areas are discovered during excavation activities, then additional excavations incorporating this confirmation sampling program will be coordinated with the OCHCA.

3.1 Confirmation Sampling

3.1.1 Soil Sampling Plan

The anticipated boundaries of the proposed excavation areas are described in **Section 2.4.1**. For all remedial excavation locations, confirmation soil samples will be collected in a manner that will allow for vertical and lateral delineation of the impacts at each location. At a minimum, confirmation soil samples will be collected as follows: One confirmation sample will be collected from the center of the excavation (deepest point) and three confirmation samples will be collected in a triangular pattern along the edge of the excavation boundary at a depth of approximately 0.5 feet bgs. The actual number and location of confirmation soil samples will be determined in the field. If any of the confirmation sample laboratory results exceed the cleanup criteria additional step-out soil samples will be collected from the excavation area to delineate the soil impacts prior to further excavation. The locations and depths of the step-out soil samples will be determined based on the specific location. An example confirmation soil sampling plan is provided on **Figures 6 and 7**.

Additional vertical excavation will be conducted if the field XRF or PID screening indicates that metals and/or PID concentrations are still above the established screening criteria (**Section 2.2**). Once the field XRF/PID screening results are below these objectives, then confirmation soil samples will be collected using the procedures noted above and submitted to BC Laboratories, Inc. in Bakersfield, California (BC Labs). BC Labs is accepted by the State of California Environmental Laboratory Accreditation Program (ELAP).

3.1.2 Soil Sampling Procedures

At each sample location, a 2-inch diameter, 6-inch long, stainless steel sample sleeve will be driven into the exposed soil using a slide hammer to collect a soil sample from the excavation surface. Sample sleeves will be labeled with the sample identification number, date, depth, location, and sampler's initials. The sleeve ends will be capped with Teflon and plastic end caps and placed in sample baggies, then in a sample cooler with ice for preservation and a chain-of-custody form for sample control purposes. The sample coolers will be transported to BC Labs for chemical analysis.

Soil lithology, field volatile vapor readings with a PID, and sample collection depths will be recorded on a boring log for each field location. Reusable sampling equipment will be decontaminated following the procedures described below. Residual decontamination rinsate will be placed in 55-gallon Department of Transportation (DOT) drums for disposal.

Equipment Decontamination

Hand tools and soil sampling equipment will be decontaminated using a three-stage process (detergent wash [i.e., Alconox] and double rinse with distilled water) between each sample location. Tools and equipment will be allowed to air dry or be wiped dry with a clean paper towel. Equipment blanks will be collected to assess the effectiveness of the decontamination process.

3.1.3 Sample Analysis

Confirmation and stockpile profile samples will be analyzed for known COPCs at the Site. All samples will be reported as a dry weight. The recommended laboratory testing methods for the confirmation and stockpile profile samples are as follows:

- TPH by EPA Method 8015B/FFP
- Metals by EPA Methods 6020/6010B, 7199, and 7471A
- VOCs by EPA Method 8260B

- SVOCs by EPA Method 8270C
- Dioxins/Furans by EPA Method by 8290
- PAHs by EPA Method 8270C-SIM or 8310

Laboratory turn-around times (TAT) will be selected based on the project schedule.

3.1.4 Quality Assurance/Quality Control

Quality Assurance/Quality Control procedures will be conducted in accordance with the Quality Assurance Project Plan (AECOM, 2020e).

- Temperature blanks will be collected at a rate of 1 per cooler. The temperature blanks consist of a vial of distilled water from the laboratory that is placed in the sample cooler and then scanned when the cooler reaches the laboratory to assess the effectiveness of the sample preservation program (i.e., ice to 4°C). Temperature blank results will be reported on the chain of custodies/in the data validation memoranda;
- One trip blank will be included in each shipping container transporting field samples for VOCs analysis in addition to the field QA/QC program, a laboratory QA/QC program will be conducted to assess the effectiveness of the sample analysis process. Additional QA/QC samples will be processed including laboratory blank samples, and analytical control samples such as laboratory control sample (LCS) and laboratory control sample duplicates (LCSD), matrix spike (MS) and matrix spike duplicate (MSD) samples, and surrogate recovery samples; and
- A QA/QC validation program will also be implemented to assess the laboratory data from the unique soil samples, the field QA/QC samples, and the laboratory QA/QC process. Validation of the laboratory data will follow EPA Stage 2A guidelines in accordance with EPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods (EPA SW-846), and the principles presented in EPA National Functional Guidelines for Laboratory Data Review, Organics (EPA, 2017), EPA National Functional Guidelines for Laboratory Data Review, Inorganics (EPA, 2017), and EPA National Functional Guidelines for High Resolution Superfund Methods Data Review (EPA, 2016). Professional judgment will be used in conjunction with the EPA National Functional Guidelines when applying validation qualifiers to the data.

4. Transportation Plan for Off-Site Disposal

A transportation plan is provided in this section for soil being disposed off-site.

4.1 Soil Characteristics to be Transported

Based on analytical soil data and the number of excavation locations described in **Section 2.4**, a maximum estimated volume of 1,043 cubic yards of non-hazardous impacted soil may be transported off-site for disposal. Actual excavated volumes will be dependent on whether additional excavation is required to remove the impacts and on the excavation methods used. Composite soil samples will be collected from stockpiles at a minimum frequency of one per every 100 cubic yards. Profile samples will be tested for the applicable analytes and test methods listed in **Section 3.1.3** above to satisfy the disposal facility testing requirements.

4.1.1 Destination of Soil

The impacted soil will be delivered to the following facility:

Non-Hazardous Arsenic Facility Name:	Waste Management Facility – Simi Valley
Address:	2801 North Madera Road Simi Valley, CA 93065-6108

4.2 Soil Transportation Mode

The excavated soil will be transported via sealed or covered end-dump trucks. It is estimated that each end-dump truck will have a capacity to haul approximately 15 cubic yards/23 tons of soil. After the soil is loaded into the transport trucks, the soil will be covered and otherwise contained to prevent soil from blowing or spilling out of the truck during transport to the disposal facility.

The selected transport company will be required to be fully licensed and insured to transport environmentally impacted soil. Prior to loading the soil into the trucks, the transport company will be required to provide proof of valid certification for the transport of impacted soil and materials and documentation on how the trucks will prevent soil from being released during transport.

4.3 Traffic Control and Loading Procedures

It is anticipated that the trucks will enter the property through the front gate from Castlewood Drive (**Figure 2; Appendix C**). A flag person will be located at the front gate to assist the truck drivers safely onto the property. Additional trucks may be staged in a designated area on-site. While on the property, all vehicles will be required to maintain speeds less than 15 miles per hour for safety purposes as well as for dust control. An on-site traffic control plan including any additional points of ingress and egress will be developed prior to implementation of the excavation activities.

The soil will be loaded directly from the excavation areas into the end-dump trucks to the extent possible. While the soil is being loaded into the trucks, dust suppression will be performed by lightly spraying the work area with water. Efforts will be made to minimize the soil drop height from the loader bucket into the transport truck. After the soil is loaded into the transport truck, the soil will be covered to prevent soil from blowing or spilling out of the truck during transport to the disposal facility. The trucking subcontractor will be required to provide trucks that do not allow soil to be spilled or blown out from the bottom, sides or tops of the trucks.

Once the transport truck has received a full load of soil, the truck will move to the exit staging area to inspect the load prior to leaving the property. The truck drivers will be required to brush their tires clean of any excavated soil from areas of their truck that is not covered or protected. This

cleanup and decontamination area will be set up as close to the loading area as possible in order to minimize spreading the impacted soil, but far enough away to not impede the next truck receiving a soil load. AECOM field staff or designated representative will be responsible for inspecting each truck to ensure that the payloads are adequately covered, the trucks are cleaned of excavated soil, and proper shipping papers are prepared (bills of lading or non-hazardous waste manifests). In addition, corrugated steel plates will be placed near the exits to prevent soil from being tracked offsite. As the trucks leave the Site, the flag person will assist the truck drivers so that they can safely merge into traffic.

4.4 Record Keeping

The AECOM field manager will be responsible for maintaining a field logbook during the remedial action activities. The field logbook will serve to document observations, on-site personnel, equipment arrival and departure times, and other vital project information including the volume and placement of soil used as backfill. Logbook entries will be complete and accurate enough to permit reconstruction of field activities. Each page will be date-stamped, and the time of entry noted. All entries will be legible, written in black ink, and signed by the individual making the entries. Language will be factual, objective, and free of personal opinions or other terminology that might prove inappropriate and/or irrelevant. If an error is made, corrections will be made by crossing a line through the error and entering the correct information. Corrections will be dated and initialed. In no circumstance will white-out or erasures be used to make corrections.

Non-hazardous soil sent off-site will be sent under a bill of lading or non-hazardous manifest. Before transporting the excavated soil off-site, an authorized representative will sign each waste manifest or bill of lading. The AECOM field manager will maintain one copy of the waste manifest or bill of lading on-site. A copy of the waste manifest or bill of lading will be included in the closure report.

5. Project Schedule

The anticipated project duration is summarized below with an anticipated start date to be determined:

Time Frame	Task Description
4 Weeks	Agency review, address comments from agency, and final Remedial Plan submittal
3 Weeks	Logistics including subcontractor selection, scheduling, and utility clearance
2 Weeks	Site preparation, conduct excavations
6 Weeks	Grading, backfill excavations/low-lying areas
8 Weeks	Final closure report submitted for agency review

6. Limitations

This report was prepared in accordance with the scope of work outlined in AECOM's contract and with generally accepted professional engineering and environmental consulting practices existing at the time of this report and applicable to the location of the Site. It was prepared for the exclusive use of PCH, for the express purpose stated above. Any re-use of this report for a different purpose or by others not identified above shall be at the user's sole risk without liability to AECOM. To the extent that this report is based on information provided to AECOM by third parties, AECOM may have made efforts to verify this third-party information, but AECOM cannot guarantee the completeness or accuracy of this information. The opinions expressed and data collected are based on the conditions of the site existing at the time of the field investigation. No other warranties, express or implied are made by AECOM.

Depth: 1
Analyte: Arsenic
Concentration: 23.1 mg/kg (B,E,H)
Sample ID: MC-145-4-1-DUP
Analyte: Arsenic
Concentration: 20 mg/kg (B,E,H)

Sample ID: MC-079-4-5
Depth: 5
Analyte: 2,3,7,8-TCDD TEQ Mammals
Concentration: 1.33E-6 mg/kg (E)

Sample ID: MC-145-4-3
Depth: 3
Analyte: Arsenic
Concentration: 13.7 mg/kg (B,H)

Sample ID: MC-079-3-10
Depth: 10
Analyte: TPHm
Concentration: 8,940 mg/kg (E,H)

Sample ID: MC-145-4-5
Depth: 5
Analyte: 2,3,7,8-TCDD TEQ Mammals
Concentration: 5.88E-06 mg/kg (E)

Sample ID: MC-079-3-15
Depth: 15
Analyte: Arsenic
Concentration: 16.6 mg/kg (B,H)

Sample ID: EG-85-0
Depth: 0
Analyte: 2,3,7,8-TCDD TEQ Mammals
Concentration: 1.65E-06 mg/kg (E)
Analyte: Lead
Concentration: 41.9 mg/kg (B,E)

Sample ID: EG-53-1
Depth: 1
Analyte: Barium
Concentration: 459 mg/kg (B,E)

Sample ID: MC-145-5-1
Depth: 1
Analyte: TPHm
Concentration: 2,630 mg/kg (E,H)

Sample ID: EG-81-1
Depth: 1
Analyte: 2,3,7,8-TCDD TEQ Mammals
Concentration: 7.29E-7 mg/kg (E)

Sample ID: MC-145-3-0
Depth: 0
Analyte: Mercury
Concentration: 0.673 mg/kg (B,E)
Sample ID: MC-145-3-0-DUP
Analyte: Mercury
Concentration: 3.58 mg/kg (B,E)

Sample ID: TS-79-T3-11
Depth: 11
Analyte: TPHg
Concentration: 820 mg/kg (E,H)

Sample ID: EG-82-0
Depth: 0
Analyte: 2,3,7,8-TCDD TEQ Mammals
Concentration: 5.95E-7 mg/kg (E)

Sample ID: MC-145-2-0
Depth: 0
Analyte: Arsenic
Concentration: 21 mg/kg (B,E,H)
Analyte: HPAHs
Concentration: 1.12 mg/kg (E)
Sample ID: MC-145-2-0-DUP
Analyte: Arsenic
Concentration: 17.9 mg/kg (B,H)

Sample ID: EG-55-5
Depth: 5
Analyte: Chromium
Concentration: 52.1 mg/kg (B,E)
Analyte: Vanadium
Concentration: 213 mg/kg (B,E)

Sample ID: MC-145-PH1-3
Depth: 3
Analyte: TPHd
Concentration: 3,890 mg/kg (E,H)

Sample ID: MC-145-PH1-6

All values are in milligrams per kilogram dry weight (mg/kg dw).
-- = not available or not applicable
DTSC Note 3 SL = Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment Note 3 Screening Level, June 2020
EPA Eco SSL = EPA Ecological Soil Screening Level, 2005-2008
EPA RSL = EPA Regional Screening Level, May 2020
LANL ESL = Los Alamos National Laboratory Ecological Screening Levels, 2017
ORNL ESL = Oak Ridge National Laboratory Ecological Screening Levels, Efroymson et al. 1997a, 1997b, and 1997c
OCHCA ESL = Orange County Health Care Agency Commercial Environmental Screening Levels for Soil
SFRWQCB ESL = San Francisco Water Quality Control Board Environmental Screening Levels for Soil, 2019

[a] The selected comparison criterion for human health is DTSC Note 3 and if not available, EPA screening levels for commercial/industrial land use; except for petroleum compounds (i.e., TPH) for which OCHCA's Screening Levels were selected. Residential screening levels are shown for informational purposes only.

[b] The selected comparison criterion for ecological health is the EPA EcoSSL as first priority, followed by the LANL ESL, and then the ORNL ESL; except for petroleum compounds (i.e., TPH) for which the SFRWQCB ESLs were selected (Table 5 also provides a summary of these values).

[c] Background (metals) = Background metals concentrations are represented by the 95th percentile for soil data presented in Hunter et al. (2005). (Hunter P., et. al. 2005): Inorganic Chemicals in Ground Water and Soil: Background Concentrations at California Air Force Bases. Available at: https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/01/Metals_Handout.pdf

[d] For metals, the final selected criterion was identified by comparing the lower of the selected human health and ecological criteria to the background level, and the higher of these two values represents the final selected criterion. For the remaining analytes, the final selected criterion was identified as the lower of the selected human health and ecological criteria.

All values are in milligrams per kilogram (mg/kg) dry weight.
The selected comparison criterion for human health is DTSC Note 3 and if not available, EPA screening levels for commercial/industrial land use; except for petroleum compounds (i.e., TPH) for which OCHCA's Screening Levels were selected.
Only samples with exceedances of the human health criteria between 0-2 feet bgs were recommended for removal based on the site-specific conceptual site model.
The selected comparison criterion for ecological health is the EPA EcoSSL as first priority, followed by the LANL ESL, and then the ORNL ESL; except for petroleum compounds (i.e., TPH) for which the SFRWQCB ESLs were selected (Table 5 also provides a summary of these values).
Only samples with exceedances of the ecological criteria between 0-6 feet bgs were recommended for removal based on the site-specific conceptual site model.
Background (metals) = Background metals concentrations are represented by the 95th percentile for soil data presented in Hunter et al. (2005).
(Hunter P., et. al. 2005): Inorganic Chemicals in Ground Water and Soil: Background Concentrations at California Air Force Bases. Available at: https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/01/Metals_Handout.pdf
* Naphthalene is a LPAH and is more appropriately evaluated grouped as Total LPAHs (EPA 2008). There are no exceedances for Total LPAHs at either parcel. However, EG-131-5 is recommended for remedial excavation due to the elevated detection of TPH - Diesel.
Eco HQ = Ecological Hazard Quotient (Maximum Concentration / Ecological Criteria)
As per discussions with OCHCA and OEHHA on November 5 and 9, 2020 , only ecological screening level exceedances with HQ ≥ 4 are considered for remedial action. A HQ ≥ 4 was approved as a cleanup goal.
-- = not available or not applicable
Value = Eco HQ ≥ 4
Yes = Yes, Remedial Excavation Proposed

Bold = Detected Concentration
ND = Not Detected Above Associated Method Detection Limit
NT = Not Tested
HDU = Historical Data Unavailable

DTSC Note 3 SL = Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment Note 3 Screening Level, June 2020
EPA Eco SSL = EPA Ecological Soil Screening Level, 2005-2008
EPA RSL = EPA Regional Screening Level, May 2020
LANL ESL = Los Alamos National Laboratory Ecological Screening Levels, 2017
ORNL ESL = Oak Ridge National Laboratory Ecological Screening Levels, Efroymson et al. 1997a, 1997b, and 1997c
OCHCA ESL = Orange County Health Care Agency Commercial Environmental Screening Levels for Soil
SFRWQCB ESL = San Francisco Water Quality Control Board Environmental Screening Levels for Soil, 2019
Residential screening levels are shown for informational purposes only
J = Estimated Concentration
UJ = Estimated Method Detection Limit
U = Not Detected, Estimated Method Detection Limit
mg/kg = Milligrams per Kilogram
= Exceeds Human Health Criteria
= Exceeds Ecological Criteria
= Exceeds Both Human Health and Ecological Criteria
All concentrations reported in dry weight

TABLE 4A
SUMMARY OF HUMAN HEALTH & ECOLOGICAL SCREENING EVALUATION PARCEL 3 LABORATORY SOIL DATA VOLATILE ORGANIC COMPOUNDS
West Coyote Hills
Fullerton, California

		Analyte:		sec-Butylbenzene	tert-Butylbenzene	Ethylbenzene	Isopropylbenzene	p-Isopropyltoluene	Methyl t-butyl ether	Naphthalene	n-Propylbenzene	1,2,4-Trimethylbenzene	1,3,5-Trimethylbenzene	o-Xylene	p- & m-Xylenes

SFRWQCB ESL = San Francisco Water Quality Control Board Environmental Screening Levels for Soil, 2019
Residential screening levels are shown for informational purposes only
* Naphthalene and phenanthrene are low molecular weight polycyclic aromatic hydrocarbons (LPAHs) and are more appropriately evaluated grouped as Total LPAHs (EPA 2008). There are no exceedances of Total LPAHs at either parcel.
J = Estimated Concentration
UJ = Estimated Method Detection Limit
U = Not Detected, Estimated Method Detection Limit
mg/kg = Milligrams per Kilogram
= Exceeds Human Health Criteria
= Exceeds Ecological Criteria
= Exceeds Both Human Health and Ecological Criteria
All concentrations reported in dry weight

		Residential Reference:		EPA RSL	DTSC Note 3	EPA RSL	DTSC Note 3	EPA RSL	--	EPA RSL	EPA RSL	EPA RSL
Boring ID	**Sample ID**	**Sample Date**	**Sample Depth**	**mg/kg**	**mg/kg**	**mg/kg**	**mg/kg**	**mg/kg**	**mg/kg**	**mg/kg**	**mg/kg**	**mg/kg**

Bold = Detected Concentration
ND = Not Detected Above Associated Method Detection Limit
NT = Not Tested
HDU = Historical Data Unavailable
Arsenic was analyzed using two methods (EPA-6010B and EPA-6020) at EG-56-1, TS-79-T3-11-1-10, EG-19-1, EG-22-1, EG-23-1; both results are shown above.

DTSC Note 3 SL = Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment Note 3 Screening Level, June 2020
EPA Eco SSL = EPA Ecological Soil Screening Level, 2005-2008
EPA RSL = EPA Regional Screening Level, May 2020
LANL ESL = Los Alamos National Laboratory Ecological Screening Levels, 2017
ORNL ESL = Oak Ridge National Laboratory Ecological Screening Levels, Efroymson et al. 1997a, 1997b, and 1997c
OCHCA ESL = Orange County Health Care Agency Commercial Environmental Screening Levels for Soil
SFRWQCB ESL = San Francisco Water Quality Control Board Environmental Screening Levels for Soil, 2019

Background = Background metals concentrations are represented by the 95th percentile for soil data presented in Hunter et al. (2005). (Hunter P., et. al. 2005): Inorganic Chemicals in Ground Water and Soil: Background Concentrations at California Air Force Bases. Available at: https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/01/Metals_Handout.pdf
Residential screening levels are shown for informational purposes only.
J = Estimated Concentration
UJ = Estimated Method Detection Limit
U = Not Detected, Estimated Method Detection Limit
mg/kg = Milligrams per Kilogram
= Exceeds Human Health Criteria and Background
= Exceeds Ecological Criteria and Background
= Exceeds Both Human Health and Ecological Criteria and Background
All concentrations reported in dry weight

TABLE 4C
SUMMARY OF HUMAN HEALTH & ECOLOGICAL SCREENING EVALUATION PARCEL 3 LABORATORY SOIL DATA METALS
West Coyote Hills
Fullerton, California

		Analyte:		Lead	Mercury	Molybdenum	Nickel	Selenium	Silver	Thallium	Vanadium	Zinc
		Commercial Human Health Criteria:		320	4.4	5800	11000	5800	5800	12	5800	350000
		Human Health Reference:		DTSC Note 3	DTSC Note 3	EPA RSL	DTSC Note 3	EPA RSL	EPA RSL	EPA RSL	EPA RSL	EPA RSL
		Ecological Criteria:		11	0.00035	15	38	0.52	4.2	0.05	7.8	46
		Ecological Reference:		EPA Eco SSL	LANL ESL	LANL ESL	EPA Eco SSL	EPA Eco SSL	EPA Eco SSL	LANL ESL	EPA Eco SSL	EPA Eco SSL
		Background:		25	0.3	20	41.5	11	2.1	25	88.3	104
		Residential Criteria:		80	1.0	390	820	390	390	0.78	390	23000
		Residential Reference:		DTSC Note 3	DTSC Note 3	EPA RSL	DTSC Note 3	EPA RSL	EPA RSL	EPA RSL	EPA RSL	EPA RSL
Boring ID	Sample ID	Sample Date	Sample Depth	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg

Bold = Detected Concentration
ND = Not Detected Above Associated Method Detection Limit
NT = Not Tested
HDU = Historical Data Unavailable
Arsenic was analyzed using two methods (EPA-6010B and EPA-6020) at EG-56-1, TS-79-T3-11-1-10.

DTSC Note 3 SL = Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment Note 3 Screening Level, June 2020
EPA Eco SSL = EPA Ecological Soil Screening Level, 2005-2008
EPA RSL = EPA Regional Screening Level, May 2020
LANL ESL = Los Alamos National Laboratory Ecological Screening Levels, 2017
ORNL ESL = Oak Ridge National Laboratory Ecological Screening Levels, Efroymson et al. 1997a, 1997b, and 1997c
OCHCA ESL = Orange County Health Care Agency Commercial Environmental Screening Levels for Soil
SFRWQCB ESL = San Francisco Water Quality Control Board Environmental Screening Levels for Soil, 2019

Background = Background metals concentrations are represented by the 95th percentile for soil data presented in Hunter et al. (2005). (Hunter P., et. al. 2005): Inorganic Chemicals in Ground Water and Soil: Background Concentrations at California Air Force Bases. Available at: https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/01/Metals_Handout.pdf
Residential screening levels are shown for informational purposes only.
J = Estimated Concentration
UJ = Estimated Method Detection Limit
U = Not Detected, Estimated Method Detection Limit
mg/kg = Milligrams per Kilogram
= Exceeds Human Health Criteria and Background
= Exceeds Ecological Criteria and Background
= Exceeds Both Human Health and Ecological Criteria and Background
All concentrations reported in dry weight

Bold = Detected Concentration
ND = Not Detected Above Associated Method Detection Limit
NT = Not Tested
HDU = Historical Data Unavailable

DTSC Note 3 SL = Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment Note 3 Screening Level, June 2020
EPA Eco SSL = EPA Ecological Soil Screening Level, 2005-2008
EPA RSL = EPA Regional Screening Level, May 2020
LANL ESL = Los Alamos National Laboratory Ecological Screening Levels, 2017
ORNL ESL = Oak Ridge National Laboratory Ecological Screening Levels, Efroymson et al. 1997a, 1997b, and 1997c
OCHCA ESL = Orange County Health Care Agency Commercial Environmental Screening Levels for Soil
SFRWQCB ESL = San Francisco Water Quality Control Board Environmental Screening Levels for Soil, 2019
Residential screening levels are shown for informational purposes only.

* Naphthalene and phenanthrene are low molecular weight polycyclic aromatic hydrocarbons (LPAHs) and are more appropriately evaluated grouped as Total LPAHs (EPA 2008). There are no exceedances of Total LPAHs at either parcel.
J = Estimated Concentration
UJ = Estimated Method Detection Limit
U = Not Detected, Estimated Method Detection Limit
mg/kg = Milligrams per Kilogram
= Exceeds Human Health Criteria
= Exceeds Ecological Criteria
= Exceeds Both Human Health and Ecological Criteria
All concentrations reported in dry weight

Notes:

Soil vapor data for Parcel 1 & 3 are provided. The full sampling report for West Coyote Hills is presented in the Soil Vapor Sampling Report - West Coyote Hills, Fullerton, CA (AECOM 2020)

Screening levels selected from DTSC (June 2020) HHRA Note 3 and, as needed, USEPA (May 2020) Regional Screening Levels (RSLs).

a = SL source is RSLs

Future attenuation factors are from DTSC (2011) and Generic attenuation factors are from USEPA (2019) Vapor Intrusion Screening Levels (VISLs)

b = The data validation concluded that the data are considered usable for its intended purpose and validated to be within acceptance criteria; the full report is presented in the Soil Vapor Sampling Report noted above (AECOM 2020).

c = Mobile lab data (shown in grey font) are observed to be inconsistent between sampling periods and not corroborated by the Fixed Lab/Summa data.

Sample depth is the last number in the Sample ID; for example "SV-11-10" was collected at 10 feet below ground surface (bgs)

Bold = detect

NA = not available

NF= Not Found

-- = no value

COPCs = chemicals of potential concern

SL AF = screening level attenuation factor

ND = Non-detect

Jones (Mobile laboratory) Data analyzed by Modified EPA Method 8260B

Cal Science Data analyzed by EPA Method TO-15

ALS Data anlayzed by EPA Method TO-17

*LCS or LCSD is outside acceptance limits
