Re: 2020 Annual Groundwater Monitoring and Remediation System  
Operation Results, Raytheon Company, Former Building 684, Fullerton, California

Dear Mr. Bernhardt:

This letter presents the results of groundwater monitoring and operation of the full-scale groundwater remediation system (groundwater remediation system) and of the soil vapor extraction system (SVE system) for the period January 2020 through December 2020 at the Raytheon Company, Former Building 684 site (the Site), located at 2357 Moore Avenue (formerly 651 North Gilbert Street), Fullerton, California (Figures 1 and 2). Groundwater monitoring was performed in general accordance with the monitoring schedule identified in the letter from Hargis + Associates, Inc. (H+A) to the California Regional Water Quality Control Board, Santa Ana Region (CRWQCB) dated November 8, 2002 (H+A, 2002).

## GROUNDWATER MONITORING

Groundwater monitoring was conducted at the Site in January, May, August, and November. The annual event was performed in August 2020 and comprised of water level measurements in accessible monitor and extraction wells and collection of groundwater samples in all accessible monitor and extraction wells (Tables 1 and 2).

## GROUNDWATER LEVELS

Water levels were measured in accessible monitor wells, extraction wells, and two Orange County Water District (OCWD) test wells in January, May, August, and November 2020 (Table 1). Figures 3 through 8 depict water level elevations obtained during annual monitoring conducted in August 2020. The August 2020 water levels are representative of groundwater conditions.

The Site hydrostratigraphic units have been previously described in detail (H+A, 2013). Shallow zone and Upper Unit A water level data obtained in August 2020 indicate the same general patterns of hydraulic head and directions of groundwater flow that have been historically observed in these units prior to remediation system operations (Figures 3 through 5) (H+A, 1997). The direction of groundwater flow in the shallow zone was generally toward the east (Figure 3), and toward the north-northeast in the deeper shallow zone (Figure 4). The direction of groundwater flow in the Upper Unit A was generally toward the Upper Unit A groundwater extraction wells (Figure 5).

Extraction of groundwater from Lower Unit A ceased in April 2004 with approval from CRWQCB (CRWQCB, 2004). In August 2020, the direction of groundwater flow in Lower Unit A was generally toward the north and northwest (Figure 6), which is consistent with the flow direction observed prior to remediation system operations (H+A, 1997).

In August 2020, the direction of groundwater flow in the A/B aquitard near the Site was toward the southwest (Figure 7), which is consistent with the flow direction observed prior to remediation system operations (H+A, 1997). The direction of groundwater flow in Unit B was toward the west (Figure 8), which was consistent with the historical trends observed in this unit (H+A, 2013).

### **GROUNDWATER CHEMICAL QUALITY**

All groundwater samples collected during monitoring activities conducted in 2020 were analyzed by Eurofins Calscience Inc., Garden Grove, California for volatile organic compounds (VOCs) using U.S. Environmental Protection Agency (EPA) Method 8260B and for analysis of 1,4-dioxane by EPA Method 8270C MOD (Appendix A). TCE was the principal VOC detected in groundwater samples collected from extraction wells at the Site. Historically, other VOCs have been intermittently detected in groundwater samples collected from various wells at the Site (H+A, 1992). However, beginning in May 2005 and persisting to date at several locations, PCE and TCE have been detected in off-Site monitor wells at concentrations that are not consistent with historical groundwater concentration trends and observed water level elevation and gradient conditions associated with the respective wells. The lines of evidence that supported the conclusion that PCE and TCE concentrations in this area were increasing as a result of one or more off-Site, non-Raytheon source(s) of PCE and TCE to groundwater were previously described (H+A, 2013).

Chain-of-custody documentation was enclosed with each sample shipment. Quality assurance/quality control samples collected during monitoring in 2020 comprised trip blanks that accompanied each sample shipment, rinsate blanks, and field duplicates.

The principal VOC in groundwater is TCE (Table 2); PCE, 1,1-dichloroethylene (1,1-DCE), and all other detected compounds can be found in Table 3. Figures depicting the concentrations of TCE, PCE, and 1,1-DCE detected in groundwater samples collected in August 2020 have been prepared (Figures 9 through 18). Water quality hydrographs depicting the concentrations of TCE in extraction well groundwater samples obtained through November 2020 have been prepared (Figures 19 through 30). Comparisons of the historical concentrations of TCE with concentrations detected in August 2020 generally indicate stable or declining trends of TCE concentrations at the Site.

### **GROUNDWATER REMEDIATION SYSTEM**

The remediation system is a semi-automated, pump-and-treat system designed to remediate groundwater at the Site in the underlying hydrostratigraphic units identified as the shallow zone and Unit A (H+A, 1993).

Full-scale groundwater remediation commenced March 12, 1996. Groundwater historically has been extracted from the Shallow Zone, Upper Unit A, and Lower Unit A. In April 2004, groundwater extraction from Lower Unit A was discontinued, as approved by the CRWQCB (CRWQCB, 2004).

During the period January 1, 2020 through December 31, 2020, the groundwater remediation system treated approximately 84,351,733 gallons of water and removed approximately 2.0 gallons of TCE. TCE concentrations detected in groundwater samples collected from extraction wells are summarized in Figures 19 through 30. Through December 2020, the full-scale remediation system has treated approximately 1,793,029,135 gallons of water and removed approximately 118 gallons of TCE.

### **SOIL VAPOR EXTRACTION SYSTEM**

The SVE system is designed to treat VOCs in soil vapor, primarily TCE, which is extracted from two dual-nested SVE wells SVE-100S/D and SVE-101S/D. These two nested sets of SVE wells both have well screens that were installed at an angle of approximately 45-degrees from horizontal. Each nested SVE well has a shallow screened interval from approximately 5 to 25 feet below land surface (bls) and a deeper screened interval from approximately 25 to 50 feet bls. The trace of the SVE well screens in a horizontal plane projected onto land surface is illustrated on Figure 31. Treated soil vapors are discharged through a 35-foot stack which is regulated by the South Coast Air Quality Management District (SCAQMD) under permit G62501, A/N 623372.

The system was operating under the permit G37741, A/N 577664 from November 2015 until August 2020. A permit modification was submitted to the SCAQMD in July 2020 for an administrative permit update due to the merger between Raytheon Corporation and United Technologies. This resulted in the issuance of the current operational permit G62501, A/N 623372, dated August 12, 2020.

During the period January 1, 2020 through December 31, 2020, the SVE system removed approximately 4.2 pounds of total VOCs and approximately 4.0 pounds of TCE (Table 4; Figure 32). In addition, system influent, effluent, and midpoint field samples were collected weekly at the SVE System and analyzed in the field using a calibrated photo-ionization detector (PID). Weekly PID measurements collected at the system were used to verify that the SCAQMD permit limits were not exceeded and, if necessary, operational adjustments were made to remain in permit compliance.

#### Narrative

#### Job Narrative 570-18811-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 1/23/2020 6:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 1.5° C and 1.6° C.

#### GC/MS VOA

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-46453.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-46961.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 570-46291 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-47276.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### GC/MS Semi VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### Organic Prep

#### Narrative

#### Job Narrative 570-28706-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 5/20/2020 10:35 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.0° C.

#### GC/MS VOA

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-72407.

Method 8260B: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 570-72407 recovered outside control limits for the following analytes: Vinyl acetate.

Method 8260B: The lot test of the laboratory trip blank water associated with 200507A indicated a detection above the method detection limit (MDL) for the following analyte(s): Methylene Chloride. All other samples associated with the job were ND for Methylene Chloride.

Method 8260B: The method blank for analytical batch 570-72407 contained Chloroform above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260B: The method blank for analytical batch 570-72427 contained Chloroform above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-72427.

Method 8260B: The method blank for analytical batch 570-72531 contained Chloroform above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### GC/MS Semi VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### Organic Prep

Method 3510C: The following sample was re-prepared outside of preparation holding time due to high surrogate HEW-0400 (570-28706-4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
